TABLES

1.1	Polish Sejm election result, October, 2015 (national figures)	page 5
1.2	Votes for the leading candidates for election for members of Polish	
	Sejm from the district of Konin, October 2015	7
2.1	Allocation of six seats by D'Hondt divisors (1, 2, 3,)	38
2.2	Allocation of seats in a six-seat district, by various quota	
	and divisor formulas	39
3.1	Possible seat allocation rules in a single-seat district	42
3.2	Example of basic seat allocation options in a single-seat district	44
3.3	Example of seat allocation by Single Transferable Vote (STV) in a	
	five-seat district	52
3.4	Example of an election under MMP: New Zealand, 2008	56
3.5	Example of an election under MMP: Japan, 2012	59
4.1	Examples of hypothetical party systems and resulting values for	
	an effective number of parties	65
4.2	Mean values of effective number of parties (seats and votes) by	
	electoral system and executive binary categories	67
-	Recent elections in Israel	75
5.2	Election results in Trinidad and Tobago, 2000–2010	79
5.3	District-level results in Trinidad and Tobago, 2007 and	
	2010 (selected)	81
	Election results in India, 2009, by alliance and party	83
6.1	Examples of election results under districted PR in Finland and	
	Portugal	87
	Results of selected districts in Portugal, 2005	88
6.3	The intraparty dimension in Finland: Southern Savo (Etelä-Savo)	
	2007	94
7.1	District magnitude and the number of seat-winning parties	111

vii

 7.2 Nationwide effects of the Seat Product, parliamentary democracions. 7.3 How assembly parties and seat product connect. 7.41 Impact of formula on ratios of actual values to Seat Product predictions. 8.1 Regression for the effective number of vote-earning parties (N_V). 9.1 Deviation from PR tends to decrease with increasing Seat Product MS. 9.2 Nationwide equations for the Seat Product Model. 9.3 Average expectations at various levels of MS. 9.41 Regressions for Deviation from Proportionality (D₂). 10.1 District level equations for the Seat Product Model. 10.2 Average expectations at various levels of M, when S=270. 10.41 How district magnitude shapes the number of parties, with and without embeddedness. 10.42 Comparing regression results for parliamentary and presidential systems. 11.41 Regression tests of models for presidential systems: the effect of the Seat Product (MS) on the effective number of presidential candidates (N_P) and the effective number of vote-earning parties (N_V) in assembly elections. 12.1 Asymmetry between assembly elections in late counter-honeymor and early honeymoon. 12.41 Regressions for party system outcomes according to elapsed time in the presidential term on the presidential term. 12.42 Regressions for the impact of elapsed time in the presidential term on the presidential vote ratio. 13.41 Regression results for number of candidates and district magnitude. 13.42 Regression results for last winner. 14.43 Regression for sults for part and vote concentration, OLPR and SNTV. 14.43 Regressions for number of list and parties at district level, systems with alliance lists. 	113
 7.A1 Impact of formula on ratios of actual values to Seat Product predictions 8.1 Regression for the effective number of vote-earning parties (N_V) 9.1 Deviation from PR tends to decrease with increasing Seat Product MS 9.2 Nationwide equations for the Seat Product Model 9.3 Average expectations at various levels of MS 9.4 Regressions for Deviation from Proportionality (D₂) 10.1 District level equations for the Seat Product Model 10.2 Average expectations at various levels of M, when S=270 10.A1 How district magnitude shapes the number of parties, with and without embeddedness 10.A2 Comparing regression results for parliamentary and presidential systems 11.A1 Regression tests of models for presidential systems: the effect of the Seat Product (MS) on the effective number of presidential candidates (N_P) and the effective number of vote-earning parties (N_V) in assembly elections 12.1 Asymmetry between assembly elections in late counter-honeymor and early honeymoon 12.A1 Regressions for party system outcomes according to elapsed time in the presidential term on the presidential tore ratio 13.A1 Regression results for number of candidates and district magnitude 13.A2 Regression results for first winner 14.A3 Regression results for last winner 14.A1 Actual and effective numbers of lists and suballiance parties in Southern Savo, Finland, 2007 14.A2 Regressions for number of list and parties at district level, systems with alliance lists

	How the actual number of seat-winning parties (N_{S0}) relates to	
	the seat product (MS), national level	104
	How the largest seat share (s_1) relates to the number of seat-winning	
	parties (N_{S0}) , left panel, and the seat product (MS) , right panel	107
	Relationship of the effective number of seat-winning parties (N_S)	
	to the largest seat share (s_1)	108
	The opposite impacts of current politics and electoral systems	120
	The effective number of vote-earning parties and the Seat Product	126
	How the effective numbers are related to the largest shares of seats	
;	and votes	130

8.3	How the largest seat and vote shares relate to the number of	
	seat-winning parties	131
8.4	The effective numbers of parties, votes versus seats	132
8.5	How current politics and the electoral system are shaped	
	by political culture	136
9.1	Deviation from proportionality (D_2) versus the difference between	
	the largest party's seat and vote shares $(s_1-\nu_1)$	143
9.2	Difference between the largest party's seat and vote shares (s_1-v_1)	
	and the seat product (MS)	145
9.3	Deviation from proportionality (D_2) and the seat product (MS)	146
9.4	Deviation from proportionality (D_2) and effective number of	
	seat-winning parties (N_S)	147
9.5	Schematic of quantities deriving from the Seat Product	149
10.1	How the magnitude of a district shapes the effective number of	
	seat-winning parties	155
10.2	How the assembly size shapes the effective number of vote-winning	
	parties in single-seat districts	156
10.3	The number of seat-winning parties and the seat share of the	
	largest party, district level	163
10.4	The seat share of the largest party and district magnitude, district	
	level	165
10.5	The actual number of seat-winning parties (N'_{S0}) and the effective	
	number of vote-earning parties (N'_V) , with incorporation of	
	district-embeddedness function (k)	168
10.6	District magnitude and the effective number of vote-earning	
	parties (N'_V) , with incorporation of district-embeddedness	
	function (k)	169
11.1	The impact of the Seat Product (MS) on the effective number of	
	presidential candidates (N_P , left panel) and the effective number of	
	vote-earning parties (N_V , right panel)	184
11.2	Relationship between the effective number of vote-earning parties	
	in assembly elections (N_V) and the effective number of presidential	
	candidates (N_P)	188
12.1	The effect of elapsed time between presidential elections on the	
	ratio of observed effective number of parties to predicted value;	400
	seats (N_S , left panel) and votes (N_V , right panel)	199
12.2	Relationship of elapsed time (E) between presidential elections	201
400	on the presidential vote ratio (R_P)	201
12.3	Effect of <i>Elapsed time</i> (<i>E</i>) on the ratio of the effective number of	
	vote-earning assembly parties (N_V) to the effective number of	204
121	presidential candidates (N_P)	204
13.1	Candidates nominated by district magnitude under open list	
	proportional representation (OLPR, left panel) and single	224
	nontransferable vote (SNTV, right panel)	221

13.2	First winner's share under OLPR and SNTV: Logical models	
	and data	226
13.3	Last winning candidate under SNTV	228
